## ACKNOWLEDGEMENTS

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida are official State and USDA estimates prepared by the Crop and Livestock Reporting Service. Corresponding data for other citrus states are from official reports of the USDA Statistical Reporting Service. Shipment and market price data are from the Marketing Bureau Section and USDA's Agricultural Marketing Service. Canned and frozen pack statistics were compiled by the Florida Cannery Association and the National Cannery Association. Where data are from other sources, appropriate footnotes appear.

Records of the Citrus and Vegetable Inspection Division of the Florida Department of Agriculture were employed in production and utilization estimates. The Growers Administrative Committee assisted in developing production estimates.

Many producers, shippers, canners, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contribution is sincerely appreciated.

CITRUS SUMMARY

PRODUCTION

Florida's production set a new record in 1966-67 of 195,920,000 boxes. This is more than 20 percent larger than the previous record of 153,740,000 boxes produced in 1961-62. Florida produced about three-fourths of the United States citrus production on approximately 71 percent of the nation's acreage.

California's 1966-67 crop of 58,100,000 boxes was the largest produced since the 1958-59 production of 59,630,000 boxes. It is still far below the record crop of 76,880,000 boxes produced in 1944-45.

The Texas crop of 8,400,000 boxes was the largest since 1960-61, but was only about one-third the size of the large crops of the mid-forties. No estimate of Texas citrus acreage has been made since 1960.

Arizona's 1966-67 crop set a new record in production as well as acreage. The production of 8,600,000 boxes was nearly a million boxes more than the record set in the previous year.

TREE NUMBERS

In the 1966-67 season, there were 49.0 million producing citrus trees in commercial groves in the state of Florida. Of these, 40.0 million are orange trees of which 19.2 million, or 48.5 percent, are early and mid-season type. Late orange trees number 19.0 million or 48.0 percent of the orange tree total. Temple orange trees accounted for 3.5 percent of the total with 1.4 million bearing trees.

COVER PICTURES

The cover pictures illustrate the steps in making an objective citrus crop forecast. The top picture shows a statistician checking a grove for variety and age in making the citrus tree census. The grove is located and its acreage measured on aerial photographs for the record and future visual reference. From this inventory of citrus trees, a random stratified sample of groves is drawn.

The upper right picture shows fruit being counted in a sample tree. Approximately 10 percent of the bearing surface of the tree, as determined by selection of a limb with known probabilities, is counted. This is to determine fruit population per tree.

The picture on the lower right shows fruit being measured by a circumference caliper. Such measurements are made in sample groves each month from August until maturity to determine the average size of fruit.

In the lower left picture, the white line marks a tagged limb on which fruit is counted each month from August until maturity to measure the rate at which drop occurs.

These four variables (trees, fruit per tree, size and drop) are utilized in a mathematical model designed to compute probable production.

The development of this highly sophisticated objective method for forecasting Florida citrus, which has produced excellent results, has been encouraged and financed by the Florida citrus industry.

Of the 5.8 million grapefruit trees, approximately 29.6 percent are seedy type and 70.4 percent are seedless type.

NON-PRODUCING ACREAGE

As of December 1965 there were 188,306 acres of non-producing citrus trees planted in Florida. This consists of 156,174 acres of oranges; 4,237 acres of Tangerines; 2,841 acres of Murcotts; 8,360 acres of Tangelos; 16,062 acres of grapefruit, and 632 acres of other citrus. Lemons and limes are not included. Planting slowed in late 1966. New aerial photographs are being made in November 1967 and a revised commercial citrus inventory will be completed in 1968. Updating is being planned for every two years in the future.

PRICES

The 1966-67 prices are the lowest received since 1947-48 when oranges averaged the same 63 cents per box; however, grapefruit at 61 cents was much more than the 26 cents received in 1947-48.

The 1966-67 prices are preliminary and represent only cash sales. Co-operative and participation returns will be included for this season in the next issue of the summary.

VALUE

Florida, All Citrus: Value of Sales, On-Tree  
Crop Years 1957-58  
through 1966-67

Year	Value	Year	Value
1957-58	\$ 213,138,000	1962-63	\$ 247,785,000
1958-59	289,769,000	1963-64	331,889,000
1959-60	220,021,000	1964-65	271,117,000
1960-61	296,516,000	1965-66	222,418,000
1961-62	247,258,000	1966-67	124,573,000

NOTE - Net contents of box varies. The Florida citrus code defines an equivalent standard box of fruit as 90 pounds for oranges and Tangelos, 85 pounds for grapefruit and 95 pounds for Tangerines. These weights have been used in these statistics for Florida. Texas average weights are 90 pounds for oranges, and 80 pounds for grapefruit. Louisiana oranges average 90 pounds per box. California and Arizona use a smaller box. California weight averages are: oranges, 75 pounds; grapefruit, 65 pounds; and lemons, 76 pounds. Arizona average weights are: oranges, 75 pounds; grapefruit, 64 pounds; and lemons, 76 pounds.
